# Option 0 - Choose target datacenter

```
root@b863562c9620: ~/slquotecli
File Edit View Search Terminal Help
root@b863562c9620:~/slquotecli#
root@b863562c9620:~/slquotecli#
root@b863562c9620:~/slquotecli# python slquotecli.py
Press the number then <enter> for the option you want:
 0. Specify target datacenter id
 1. Show all SoftLayer_Product_Package(s) active in this account
 2. List SoftLayer_Product_Package *required* options for a given package (use 'id' from menu option 1)
 3. List SoftLayer_Product_Package *all* options for a given package (use 'id' from menu option 1)
 4. Create product container
 5. Select a product container for editing
 6. List existing product container(s)
 7. Unload product container - make sure you save it first
 8. Set container deployment location (use id from menu option 0 / 19)
 9. Set container package id (use id from menu option 1)
10. Set container price ids (use column 1 from menu option 2 / 3)
11. Set the container quantity value (number of servers of this container type)
12. Show the in progress quote containers
13. Verify a quote (uses all loaded product containers)
14. Place a quote (uses all loaded product containers)
15. Export Product containers to disk (JSON)
16. Import Product containers (*.json) in current dir
17. Download Quote Pdf for an existing portal quote id
18. Show all quotes in account
19. List Location_DataCenter (DC locations)
20. Show currently selected datacenter
21. Troubleshooting options menu
22. Exit to shell - make sure you save things you want before leaving

You chose "4"

The following package containers are currently cached / loaded:

[]

Quotes (and fwiw orders) are composed of one or more containers  
If you need multiple servers of the same configuration  
it makes sense to use the quantity attribute of the container  
as opposed to creating one container per server  
unless you have no other task to complete right now...

Enter a name (using chars: [A-z1-0]) for this container

If you specify the name of an existing container, we'll overwrite it.  
You won't get warned again before that happens.

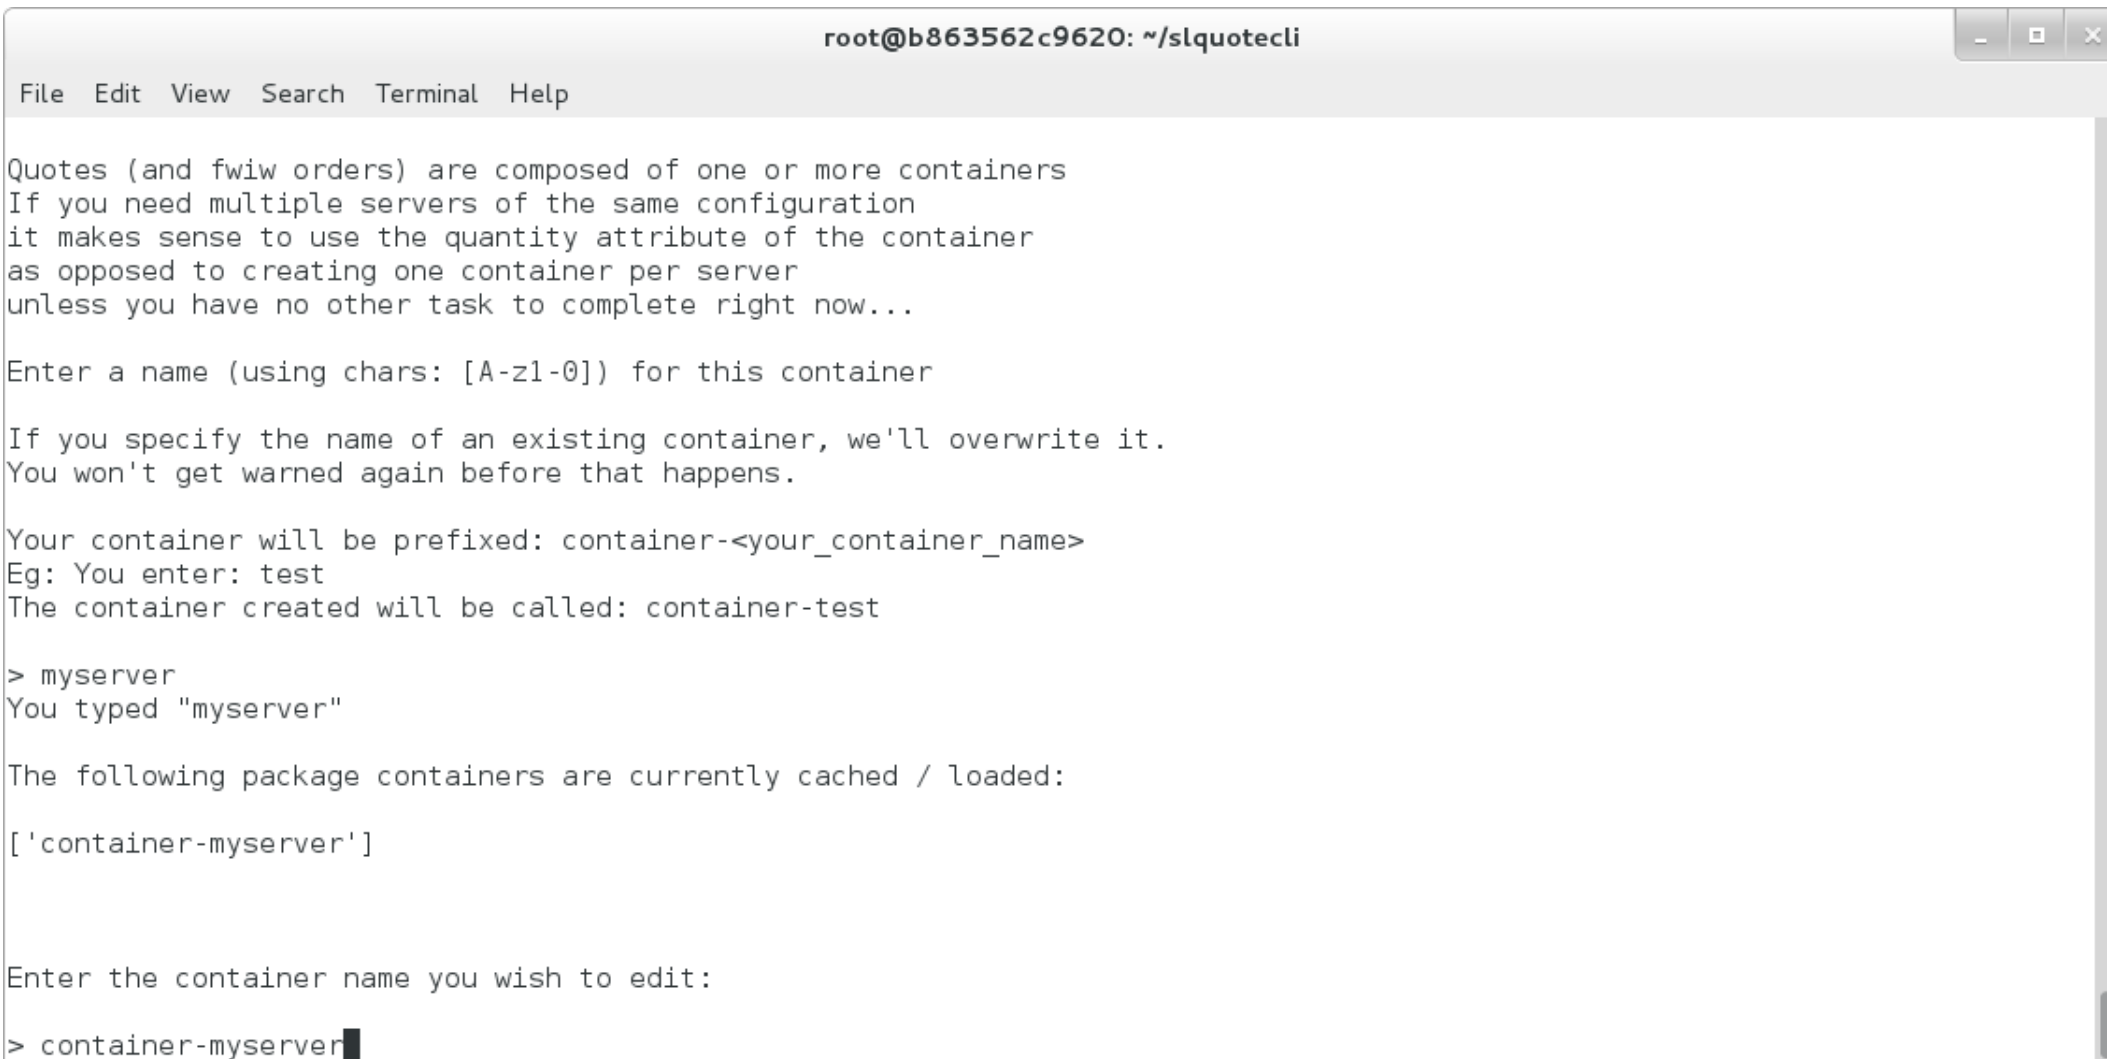

Your container will be prefixed: container-<your\_container\_name>

Eg: You enter: test

The container created will be called: container-test

> myserver

# Specify the container for modification, using the full container name

```
root@b863562c9620: ~/slquotecli
